## Abstracts

The global Concrete Densifier market size is expected to reach \$ 1776 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032). Global sales of concrete densifiers reached 260048 kiloliters in 2025, with an average price of \$4,621 per kiloliter.

A concrete densifier is a chemical applied to a concrete surface in order to fill pores, increasing surface density. Chemical densifiers are used on polished and non-polished concrete to reduce dusting and wear; on polished concrete surfaces densifiers help concrete take a better polish and make the surface less permeable to liquids so the slab does not require sealing.

The supply of raw materials for concrete densifiers is significantly dependent on inorganic chemicals and is highly intensive in formulation technology. Their cost structure varies considerably depending on the type of silicate. Raw material costs account for 50-60% of the total cost, with silicate main materials (lithium silicate, sodium silicate, potassium silicate, or magnesium fluorosilicate) accounting for 30-40%. Lithium-based materials are the most expensive (approximately 20,000-30,000 RMB/ton), while sodium-based materials are the least expensive (approximately 3,000-5,000 RMB/ton). Additives (surfactants, penetrants, stabilizers) account for 10-15%, and deionized water accounts for 5-10%. Processing and manufacturing costs account for approximately 20-25%, including processes such as dissolution, compounding, filtration, and filling. The process is relatively simple but requires strict control of pH (usually 11-13) and viscosity. It is worth noting that nano-scale lithium-based products require special dispersion technology, which increases processing costs by 30%-50%. Brand and channel costs account for 15-20%. Quality control and testing costs account for 5-10%, requiring testing of indicators such as solid content, pH, density, penetration depth, and

surface hardness (Mohs hardness increase). Overall, concrete densifiers are low-to-medium priced, high-turnover, and technologically differentiated building chemicals. Their cost structure is influenced by multiple factors, including fluctuations in silicate raw material prices, formulation complexity (single silicate vs. composite modification), and the added value of construction services. The industry is upgrading from sodium/potassium-based to lithium-based and nano-scale products, while facing technological competition from new efflorescence-free products such as colloidal silica.
