Abstracts

Good boiler water management programs includes regular condensate testing by boiler operators and the contracted water management specialist. Even though it is necessary to return maximum quantity of condensate substance to the boiler, it is necessary to ensure that the condensate is pure. Even tiny amounts of contamination can cause scaling, foaming, or corrosion. If the boiler water is carried over when steam occurs, the substance can get contaminated, which can result in expensive lost production.

Condensate Contamination Detection Systems monitors the conductivity of condensate being sent back to the boiler and diverting contaminated substances to the drain. The corrosive nature of fluids in the biodiesel refinery, steam heat condensers and other equipment have a risk of leaking fluids which can be hazardous where the contaminated solutions reaches the boilers. Condensate Contamination Detection System are a conductivity as well as pH based systems which gains maximum possible heat from the processes where possibilities of contamination are high. Condensate contamination detection system watches the pH condensate and conductivity returned to the boiler and sends the contaminated condensate to the drain after gaining the heat it possess through a plate heat exchanger. Condensate steam together possess approximately 20% of the heat present in steam and hence, recovering the condensate improves the efficiency of the overall system. In many process applications, vital condensate is drained fearing contamination. Condensate Contamination Detection systems consist of a sensor chamber and conductivity sensor and temperature sensor, arranged in condensate line bypass. The sensors are attached to low range controller that constantly monitor and display the conductivity level which help in preventing the loss of steam.

SCOPE OF THE REPORT:

This report focuses on the Condensate Contamination Detection Systems in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Condensate Contamination Detection Systems help in avoiding boiler damage and product contamination.

The temperature compensation sensor delivers accurate results irrespective of the condensate temperature.

Condensate Contamination Detection Systems reduce wastage of energy. Helps in the conservation of high-priced treated water. In many processes, valuable condensate gets drained due to the fear of contamination. The turbidity and oil detector of condensate contamination detection systems are used in monitoring drinking and cooling water, beverages and condensates. It helps in monitoring the hot water in different heating plants, and micro filters and helps in keeping water cool on boats. It is equipped with an alternative valve layout in which 2-port valves can be used. Condensate Contamination Detection Systems detect if there exists risk of entrance of whey products, hydrocarbons, etc.

The worldwide market for Condensate Contamination Detection Systems is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
