## Abstracts

The global Condenser Bushing market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A condenser tube is a pipeline used to convert gaseous fluids (such as steam or gas) produced in a condenser into liquid form. Condenser tubes are typically made of metal materials such as steel, copper, and aluminum because these metals have good thermal conductivity and mechanical strength, and can withstand harsh environments such as high pressure and high temperature. In some applications, non-metallic materials such as plastic may also be used to manufacture condenser tubes. The main function of condenser tubes is to draw gaseous fluids from the condenser into the pipeline, transport and cool the fluids through the pipeline, and transform them into liquid form for storage and transportation. They are widely used in fields such as air conditioning, refrigerators, automobiles, and industrial production.
