Abstracts

According to our (Global Info Research) latest study, the global Conductive Thermoplastics market size was valued at US\$ 5253 million in 2025 and is forecast to a readjusted size of US\$ 7307 million by 2032 with a CAGR of 4.9% during review period.

Conductive Thermoplastics are thermoplastic polymer materials engineered to exhibit electrical conductivity or static-dissipative properties by incorporating conductive fillers or inherently conductive polymers. Unlike conventional insulating plastics, conductive thermoplastics provide controlled electrical pathways while retaining the processing advantages of thermoplastics, such as extrusion, injection molding, and thermoforming. Conductive fillers commonly used include carbon black, carbon nanotubes (CNTs), graphene, metal powders, or hybrid conductive systems, which form an interconnected network within the polymer matrix to enable charge transport. These materials are widely applied in anti-static components, electronic housings, cable sheathing, automotive fuel system parts, battery modules, sensors, and electromagnetic interference (EMI) shielding applications. Key performance attributes include surface and volume resistivity, mechanical property retention, thermal stability, processing compatibility, and long-term conductivity stability.
