Abstracts

The global Cone Beam Breast CT(CBBCT) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Radiation dose from cone-beam breast CT depends on the intended use (such as screening or diagnostic evaluation) and whether the study also involves the use of contrast media. CONCLUSIONS: Compared with mammography, cone-beam CT of the breast provides a significant improvement in radiation dose to soft-tissue lesions when used for screening. Radiation doses for diagnostic imaging with cone-beam breast CT are within the range of diagnostic mammography. Studies have shown that when cone-beam breast CT is used for diagnostic evaluation, the average glandular dose ranges from 7 to 13.9 mGy [45-48]. With the development of technology, the average glandular dose will gradually decrease.

CBBCT is a dedicated breast CT imaging technology based on cone beam X-rays and flat-panel X-ray detectors.
