Abstracts

A cone crusher is similar in operation to a gyratory crusher, with less steepness in the crushing chamber and more of a parallel zone between crushing zones. A cone crusher breaks rock by squeezing the rock between an eccentrically gyrating spindle, which is covered by a wear-resistant mantle, and the enclosing concave hopper, covered by a manganese concave or a bowl liner. As rock enters the top of the cone crusher, it becomes wedged and squeezed between the mantle and the bowl liner or concave. Large pieces of ore are broken once, and then fall to a lower position (because they are now smaller) where they are broken again. This process continues until the pieces are small enough to fall through the narrow opening at the bottom of the crusher.

Scope of the Report:

This report focuses on the Cone Crusher in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. In the coming years there is an increasing demand for cone crusher in the regions of Asia-Pacific and South America that is expected to drive the market for more advanced cone crusher. Increasing of construction industry fields expenditures, more-intense competition, launches in introducing new products, increasing of spending on machinery manufacturing industry, retrofitting and renovation of old technology, increasing adoption of cone crusher will drive growth in global market.

Globally, the cone crusher industry market is low concentrated as the manufacturing technology of cone crusher is relatively matures than some high-tech equipment.
