Abstracts

The global Conference Voting Software market size is expected to reach \$ 666 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Meeting voting software is an interactive tool system based on digital technology. Connected via the internet or local area network, it enables proposal voting, opinion collection, and democratic decision-making in various meeting scenarios. It typically integrates core modules such as agenda creation, voting option settings, real-time screen projection, anonymous/real-name switching, and automatic result statistics and export. Participants can participate with a single click via mobile phone, tablet, or computer. This software aims to replace the inefficient traditional paper-based voting or hand-raising methods, using digital means to improve meeting transparency and decision-making efficiency. It is widely used in formal occasions such as corporate board meetings, shareholder meetings, and academic seminars.

With the popularization of hybrid office models and the maturity of the digital office ecosystem, meeting voting software is ushering in a broad development prospect. In the future, this software will deeply integrate artificial intelligence and big data analysis technologies, not only enabling automatic voice generation of voting agendas and intelligent identification of vote-rigging violations, but also capturing real-time feedback from participants through sentiment analysis. In terms of security, the introduction of blockchain technology will ensure the immutability and traceability of each ballot, meeting the compliance requirements of high-level government and business meetings. Furthermore, the implementation of the metaverse concept will give rise to three-dimensional immersive voting scenarios, allowing remote participants to obtain a near-realistic on-site voting experience through virtual identities, and promoting global

collaborative decision-making into a new intelligent stage.
