According to our (Global Info Research) latest study, the global Confocal Interferometer market size was valued at US\$ 382 million in 2024 and is forecast to a readjusted size of USD 602 million by 2031 with a CAGR of 6.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The confocal interferometer is a high-resolution spectral analysis instrument designed based on the principle of light interference. It usually consists of two spherical concave mirrors with equal curvature radius and cavity length to form a confocal cavity. The optical path difference of adjacent coherent light beams is used to determine its resonant frequency. The light is divided into two beams with different propagation paths and then recombined to produce interference, thereby analyzing the spectral line profile, hyperfine structure and isotope shift. It is particularly suitable for analyzing the laser output mode spectrum structure, monitoring single-frequency laser output and detecting phase-locked effects. The confocal interferometer has unique advantages in the field of optics. Its confocal structure makes it more capable of collecting light on rough surfaces and can effectively collect light from extended light sources. As a passive cavity, it can act as a tunable narrow bandpass filter and achieve spectral scanning by changing the cavity length. It plays an important role in laser spectral measurement, spectral analysis and surface quality inspection of optical components.
