According to our (Global Info Research) latest study, the global Confocal Spherical Scanning Interferometer market size was valued at US\$ 244 million in 2024 and is forecast to a readjusted size of USD 381 million by 2031 with a CAGR of 6.6% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The confocal spherical scanning interferometer is a high-precision optical measurement device built on the principle of multi-beam interference. Its core structure consists of two spherical mirrors with equal curvature radius forming a confocal cavity. When the incident light enters the cavity, it is reflected multiple times in the cavity to form a standing wave field. Only when the light of a specific wavelength meets the resonance condition (the cavity length is an integer multiple of half the wavelength), constructive interference occurs and is transmitted. The piezoelectric ceramic drives the mirror to change the cavity length to achieve wavelength scanning, and finally outputs the interference fringe signal corresponding to the spectrum component of the light to be measured on the photodetector.
