## Abstracts

The global Conical Cyclone Desander market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Conical cyclone desander is a type of solid control equipment that uses a set of hydrocyclones to separate sand and silt from the drilling fluids in drilling rigs. It is installed on top of the mud tank following the shale shaker and the degasser, but before the desilter. It removes the abrasive solids from the drilling fluids which cannot be removed by shakers.

The basic principle of the conical cyclone desander is to use centrifugal force to introduce the fluid tangential direction into the conical shell of the cyclone desander. The gravity action pushes the solid particles to the surface of the cone and runs down to the outlet of the separator.

This report studies the global Conical Cyclone Desander production, demand, key manufacturers, and key regions.
