Abstracts

The global Constant Current Tungsten Light Source market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Constant current tungsten light source is a common type of light source, usually used in fields such as photography, stage lighting and film and television production. It uses a tungsten wire as a light-emitting element, and drives the tungsten wire to emit light through a constant current. The working principle of the constant current tungsten light source is that when the current passes through the tungsten wire, the tungsten wire generates high temperature and emits light. When the tungsten wire is in a high temperature state, it will emit strong white light, resulting in a high-brightness lighting effect. The constant current tungsten light source has several characteristics. First of all, it has high brightness and color temperature stability, which can provide continuous and uniform light output. Secondly, the constant current drive can ensure the stability of the light source and avoid light flicker or fluctuation. In addition, the tungsten filament has a long service life and can provide stable lighting for a long time. However, constant current tungsten light sources also have some disadvantages. Due to the high temperature working conditions of tungsten wires, they will generate more heat and require proper heat dissipation measures. In addition, the constant current tungsten light source has low energy efficiency and consumes more electric energy. In recent years, with the development of LED technology, LED light source has gradually replaced the position of constant current tungsten light source in many applications. LED light sources have higher energy efficiency, longer life and more flexible control characteristics, so they are widely used in the lighting industry.
