## Abstracts

Constant-velocity joints (CV joints) allow a drive shaft to transmit power through a variable angle, at constant rotational speed, without an appreciable increase in friction or play. They are mainly used in front wheel drive vehicles, and many modern rear wheel drive cars with independent rear suspension typically use CV joints at the ends of the rear axle halfshafts and increasingly use them on the propshafts (drive shafts).

Scope of the Report:

This report focuses on the Constant Velocity Universal Joint in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. In the next years, the growth rate of automotive production may decrease in Europe and US, but the enormous automotive population will provide large market demand. In China, the growth rate of automotive production will still be higher than other regions. The situation of automotive constant velocity universal joint industry will be the same. There is large technical gap between automotive constant velocity universal joints produced by manufacturers from China and abroad. To maintain market share, these domestic manufacturers must invest more on research and development. In China, the distribution of automotive manufacturers is relatively concentrated, which means the downstream market is concentrated. To get rid of the limit and reduce the risk, automotive constant velocity universal joint manufacturers should seek more automotive manufacturers as cooperative partners. The worldwide market for Constant Velocity Universal Joint is expected to grow at a CAGR of roughly 1.0% over the next five years, will reach 7870 million US\$ in 2023, from 7410 million US\$ in 2017, according to a new GIR (Global Info Research) study.
