Abstracts

Constrained Layer Damping (CLD) is a system used to suppress vibrations in various machineries such as ship structures, vibrations caused due to propellers, mounted machinery, etc. It is made of two sheets that are rigid, however, have poor damping properties. A damping material such as viscoelastic is placed between the two sheets. When the surface vibrates, it is trapped between the two sheets and degenerated in the constrained layer as sheer energy.

According to our (Global Info Research) latest study, the global Constrained Layer Damping market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
