According to our (Global Info Research) latest study, the global Construction Bulldozer market size was valued at US\$ 3243 million in 2024 and is forecast to a readjusted size of USD 4022 million by 2031 with a CAGR of 3.1% during review period.

A construction bulldozer is a piece of construction equipment used mainly in construction work to remove, transport, and level the ground. A bulldozer is a heavy machine with an earth removal plate called a blade attached to the front of its body. Its main role is to push earth and sand in the direction of travel to level the ground. By changing attachments, the bulldozer can perform various types of work. There are two types of drive systems: crawler (infinite track) type and wheel type.

Bulldozers are used for earth removal, pushing, and leveling in construction work. These include civil engineering, dam construction, building construction, and site development. They are also used for snow removal and wetland work. By changing attachments, bulldozers are used for digging up and moving large rocks, root cutting, etc.

Bulldozers are available for special work. At disaster sites, they are operated by radio control. Amphibious bulldozers work by radio control and are used in places where dredgers cannot enter or leave. Underwater bulldozers can travel on the seabed and are remotely controlled by divers.
