Abstracts

According to our (Global Info Research) latest study, the global Construction Hoist Floor Call System market size was valued at US\$ 268 million in 2025 and is forecast to a readjusted size of US\$ 364 million by 2032 with a CAGR of 4.4% during review period.

A Construction Hoist Floor Call System is a purpose-built on-site communication and dispatch device mounted on every operational floor of a construction project, integrated with the control system inside the construction hoist cabin. It enables construction personnel on individual floors to send landing request signals to the hoist operator via dedicated call buttons, transmits floor identification data through wired or wireless transmission channels, presents real-time calling floor information on the in-cabin display unit, and typically incorporates auxiliary functions including call acknowledgement, fault alarm and floor address customization. This system effectively boosts vertical transportation efficiency, cuts down unnecessary hoist stops and waiting time, and standardizes the management of personnel and material delivery on construction sites.

In 2025, global Construction Hoist Floor Call System production reached approximately 703 K units, with an average global market price of around US\$ 370 per unit. The production capacity of Construction Hoist Floor Call System is approximately 889 K units per year, the average gross profit margin was 28-31%.

In the supply chain of the construction hoist floor call system, the upstream segment primarily comprises raw material and component suppliers, including vendors of core electronic components (microcontroller units, wireless transceivers, digital displays, push buttons, power modules), plastic and metal structural housings, connecting cables

and printed circuit boards, as well as service providers offering embedded software development and hardware schematic design; the midstream consists of specialized manufacturers and system integrators that undertake product R&D, assembly, functional testing, quality validation and finished product packaging; the downstream segment mainly covers construction hoist original equipment manufacturers that adopt the system as standard or optional configuration, construction general contractors, construction equipment leasing firms, on-site end users, and third-party teams delivering on-site installation, commissioning and after-sales maintenance services.

The cost structure of the construction hoist floor call system is dominated by direct material cost, which generally accounts for 60% to 70% of the total cost and covers core electronic components, structural housings, power supply units and connecting accessories. It is followed by labor cost for production assembly, on-site installation and after-sales technical support, R&D expenditure allocated to hardware circuit design, embedded firmware development and prototype verification, manufacturing overhead including production equipment depreciation, workshop rental and quality inspection expenses, and operational management costs such as marketing, administrative expenses and after-sales service reserves. Fixed costs account for a relatively small share, and the overall cost is highly sensitive to price fluctuations of upstream electronic components.
