According to our (Global Info Research) latest study, the global Contact Lens Injection Molding Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A Contact Lens Injection Molding Machine is a specialized piece of equipment used in the manufacturing process of contact lenses. Contact lenses are typically made from a variety of materials, including hydrogels or silicone hydrogels. The injection molding process is commonly used to shape these materials into the desired contact lens forms.

The injection unit is responsible for melting and injecting the contact lens material into the mold. It includes a hopper for raw material, a barrel where the material is melted, and a screw or plunger that pushes the material into the mold. The mold is a crucial part of the machine. It's designed to shape the molten contact lens material into the desired lens form. The mold is typically made of two halves that come together during the injection process.

The clamping unit holds the mold in place during the injection process. It consists of a stationary platen and a movable platen that applies the necessary pressure to keep the mold closed and secure during injection. The injection molding process generates heat due to the melting of the material. A cooling system is incorporated to maintain the proper temperature within the mold and ensure the material solidifies into the desired lens shape.
