According to our (Global Info Research) latest study, the global Continuous Electrodeionization Systems (CEDI) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Continuous Electrodeionization (CEDI) is a water treatment technology used to remove ions, dissolved salts and other impurities from water. It is developed on the basis of ion exchange and electroadsorption technology.

CEDI systems usually consist of a series of alternating cation exchange membranes and anion exchange membranes with electrodes sandwiched between the two membranes. As water flows through the spaces between these membranes and electrodes, an electric field is applied to drive the migration of ions.

In the CEDI system, cations in the water will migrate from the water to the anion exchange membrane, and anions will migrate from the water to the cation exchange membrane. Through the action of the electric field, cations and anions are driven to corresponding electrodes respectively, thereby removing the ions from the water. At the same time, impurities and microorganisms will also be isolated between membranes to achieve water purification.

CEDI systems offer many advantages over traditional ion exchange technology. First, CEDI systems do not require regenerants or chemicals, thus avoiding the need for regeneration processes and waste disposal. Secondly, the CEDI system can operate continuously without shutting down or changing columns, which improves processing

efficiency and stability. In addition, the CEDI system can provide water with high purity and low ion concentration, and has the advantages of easy operation and small footprint.
