Abstracts

The global Continuous Fiber Reinforced Thermoplastic Sheet(CFRTP Sheet) market size is expected to reach \$ 230 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Continuous fiber reinforced thermoplastic sheet is a high-performance, instant-formable flat composite preform made by completely impregnating and solidifying continuous, uncut long fibers (such as glass fiber, carbon fiber, and aramid fiber) in a thermoplastic resin matrix (such as PP, PA6, and PEEK) through a special process. The core advantage lies in the continuity of the fibers, which gives them mechanical properties (especially strength and impact resistance) far exceeding those of short or long fiber reinforced materials, approaching those of thermosetting composites, while also possessing the advantages of thermoplastic materials such as recyclability, weldability, and rapid prototyping. Demand stems directly from the urgent needs of downstream industries such as automotive, aerospace, and high-end sporting goods for structural components that require 'lightweighting,' 'high mechanical performance,' and 'rapid and efficient production.' The upstream mainly includes continuous fiber (glass fiber, carbon fiber) manufacturers and high-performance thermoplastic resin (such as PP, PA, PEEK) suppliers; the downstream consists of component manufacturers (such as Tier 1 automotive suppliers and sporting goods manufacturers). They purchase CFRTP sheets and manufacture the final structural components using rapid hot pressing molding processes, which are then used in end products such as car bodies, battery packs, aircraft interiors, and high-performance bicycle frames. In 2025, the production of continuous fiber reinforced thermoplastic sheets is estimated at approximately 10,000 tons, with an average price of approximately US\$15/kg, a gross profit margin of approximately 35%, and a single-line capacity of 120 tons/year.
