According to our (Global Info Research) latest study, the global Continuous Flexible Foaming Machine market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A continuous flexible foaming machine is an advanced industrial apparatus designed to produce flexible polyurethane foam in a continuous process. This machine automates the mixing and dispensing of polyurethane components, typically polyols and isocyanates, along with various additives, to create a consistent and high-quality foam material. The continuous process involves the precise metering and mixing of ingredients, followed by controlled pouring onto a moving conveyor where the foam expands and cures as it progresses. This method allows for the efficient production of large volumes of flexible foam, which is commonly used in applications such as furniture cushioning, mattresses, automotive seating, and packaging. Continuous flexible foaming machines are integral to manufacturing operations that require uniformity, scalability, and efficiency in foam production.
