According to our (Global Info Research) latest study, the global Continuous Pyrolysis Furnace market size was valued at US\$ 270 million in 2024 and is forecast to a readjusted size of USD 338 million by 2031 with a CAGR of 3.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A continuous pyrolysis furnace is a specially designed heat treatment equipment, which is mainly used to cause a series of chemical reactions such as pyrolysis, oxidation, reduction, and reforming of polymers of solid organic matter such as biomass, sludge, tires, and industrial solid waste under the condition of complete or partial lack of oxygen through the action of an external heat source. In a continuous pyrolysis furnace, solid organic matter is placed in a specific reaction chamber, and sufficient heat is provided by an external heat source (such as a burner, an electric heater, etc.) to cause the organic matter to undergo pyrolysis in an oxygen-deficient or micro-oxygen environment. During the pyrolysis process, the macromolecular structure of the organic matter is cracked into small molecular substances, such as combustible gases such as CO, H₂, and CH₄, as well as microporous carbon with fixed carbonaceous bodies.
