Continuous spinning viscose filament yarns are fine, high-strength fibers produced through a continuous manufacturing process involving the transformation of wood pulp or cellulose into viscose. In this process, the cellulose is chemically treated to create a viscous solution, which is then extruded through spinnerets into a coagulating bath, forming long, continuous filaments. These filaments are subsequently stretched, solidified, and wound onto spools as yarns. Continuous spinning ensures smooth, uniform filament formation and consistent quality, resulting in viscose yarns with excellent drape, softness, and sheen. These yarns are widely used in textiles for fabrics, apparel, home furnishings, and industrial applications due to their silk-like texture and breathability.
