Abstracts

According to our (Global Info Research) latest study, the global Continuous Vacuum Belt Filter market size was valued at US\$ 453 million in 2025 and is forecast to a readjusted size of US\$ 665 million by 2032 with a CAGR of 5.5% during review period.

Continuous Vacuum Belt Filter refers to a horizontal solid-liquid separation machine in which slurry is continuously distributed onto a moving filter cloth. Vacuum generated beneath the filtration surface draws liquid through the filter medium, while solids form a filter cake that can be washed, further dewatered, dried, and continuously discharged at the end of the belt.

The market mainly includes rubber-supported horizontal vacuum belt filters, moving-tray vacuum belt filters, open horizontal belt filters, hooded filters, and fully enclosed systems. Continuous machines generally integrate slurry feeding, cake formation, vacuum filtration, cake washing, dewatering, cake discharge, filter-cloth cleaning, and filtrate collection in one operating line.

The 2025 benchmark ASP is US\$500,000 per unit, global sales volume is approximately 880 units, and the estimated average gross margin is approximately 34%. The upstream industry chain includes structural steel, stainless steel, corrosion-resistant alloys, rubber carrier belts, filter cloths, vacuum boxes, wear strips, rollers, pulleys, bearings, seals, vacuum pumps, blowers, filtrate receivers, spray nozzles, motors, gear reducers, sensors, and control components. The midstream includes filtration testing, process design, structural engineering, equipment fabrication, vacuum-system integration, belt and cloth installation, automation configuration, assembly, testing, installation, and commissioning. The downstream mainly covers mining and

metals, chemicals, fertilizers, food and beverage, pharmaceuticals, power and environmental processing, and other industrial solid-liquid separation sectors.

Demand for continuous vacuum belt filters is supported by expansion in mineral processing, tailings water recovery, hydrometallurgy, phosphoric-acid production, battery-material processing, chemical-product purification, and industrial resource recovery. The equipment is particularly suitable for high-throughput applications requiring visible continuous operation, effective cake washing, flexible filtration-zone design, and simultaneous recovery of valuable solids and filtrate.

Compared with many batch filtration systems, horizontal vacuum belt filters provide continuous material flow and allow filtration, multi-stage washing, dewatering, and cake discharge to be arranged sequentially along the belt. Modular designs can also accommodate different filtration areas, cake thicknesses, washing stages, construction materials, and enclosure requirements.

Future development will focus on higher water recovery, lower cake moisture, reduced vacuum-energy consumption, improved belt tracking, lower friction and sealing-water use, automatic slurry-distribution control, intelligent vacuum zoning, predictive maintenance, corrosion-resistant structures, and enclosed filtration for hazardous or solvent-containing materials.
