Abstracts

The global Contraceptive Diaphragm market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The contraceptive diaphragm is a barrier method of birth control that is inserted into the vagina before sexual intercourse to prevent pregnancy. It is a small, flexible, dome-shaped cup made of silicone or latex rubber that is inserted into the vagina and covers the cervix, which is the opening to the uterus.

The contraceptive diaphragm works by preventing sperm from reaching the egg. It is usually used with a spermicide, which is a substance that kills sperm. The spermicide is applied to the diaphragm before insertion, and it helps to immobilize and kill any sperm that may enter the vagina.

The contraceptive diaphragm is 88-94% effective at preventing pregnancy when used correctly every time. However, it does not protect against sexually transmitted infections (STIs).

The diaphragm must be fitted by a healthcare provider to ensure that it fits properly and is effective. It should also be checked periodically to ensure that it is still in good condition and fits properly.
