Abstracts

The global Cooking Oil Fume Monitor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

With the rise of the tertiary industry, the catering service industry has developed rapidly, bringing convenience to people's lives, but the direct emission of oil fume also causes pollution to the atmospheric environment. The composition of oil fume gas is complex, and the particulate matter and volatile gaseous organic matter in oil fume gas are one of the important reasons for the formation of haze. In order to effectively promote the treatment of atmospheric environment, oil fume treatment is imperative.

Cooking smoke emissions have large numbers of widely distributed feature. The traditional cooking smoke emission supervision is mostly for regular on-site inspections by relevant government departments. However, this method has the problems of high cost and low efficiency, and it could not completely and efficiently solve the problem of oil fume pollution. In recent years, with the promotion of various environmental policies, many areas have begun to introduce cooking oil fume online monitoring systems, which can remotely and real-time monitor whether the oil fume emission in the area could meet standard or not. So accurate control for oil smoke pollution could be achieved. At the same time, it also saves a lot of manual inspection costs.

An online oil fume monitor is a device used to continuously monitor and measure the concentration of oil fumes or particulate matter (PM) generated from cooking processes in commercial kitchens, industrial settings, or other environments where cooking activities produce airborne pollutants. Oil fumes are produced when cooking oils, fats, and other substances are heated, and they can contribute to indoor air pollution and potential health hazards if not properly managed.

The purpose of an online oil fume monitor is to assess and maintain air quality by monitoring the levels of oil particulates in the air and providing real-time data to alert operators or facility managers if pollutant levels exceed acceptable limits. This allows for timely intervention, ventilation adjustments, or equipment maintenance to mitigate the impact of cooking-generated pollutants on indoor air quality.
