A coolant distribution unit (CDU) is a device used in liquid cooling systems for data centers or high-performance computing (HPC) applications. Its primary function is to distribute and regulate the flow of coolant throughout the cooling system.

A CDU typically contains pumps, heat exchangers, sensors, and other components that help to ensure that the coolant is distributed evenly and at the proper temperature. The coolant, usually water or a specialized liquid, absorbs heat from the electronic components in the data center or HPC system and is then pumped through the CDU to a cooling tower or other heat rejection device, where the heat is dissipated into the environment.

CDUs can come in different sizes and configurations depending on the specific application and cooling requirements. They are an essential component of liquid cooling systems, which are increasingly used in data centers and other high-performance computing environments to improve energy efficiency and reduce cooling costs.
