Abstracts

According to our (Global Info Research) latest study, the global Cooled Infrared Detector Single Element market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Cooled infrared detectors generally refer to detectors made using the photon effect of semiconductor materials. The photoelectric effect requires the semiconductor to be cooled to a lower temperature before it can be observed, so the infrared system needs to be cooled before it can be used. Due to the advantages of refrigerated infrared detectors such as high sensitivity, the ability to distinguish more subtle temperature differences, fast response speed, and long detector distance, they are widely used in high-end weapons and equipment. The detector unit is a detector made based on the photoconductivity effect. It uses the property of semiconductor materials that the conductivity changes under light to convert the received light signal into an electrical signal output. This detector has the characteristics of fast time response, large output current, small size, and light weight. It shows high sensitivity to various radiations such as X-rays, visible light, and charged particles.

The market is constantly changing, and the following points are worth noting:

The market concentration is high.

The EU RoHS3 directive points out the restriction of the use of certain hazardous substances in electrical and electronic equipment. It regulates the use and introduction of hazardous substances in electrical and electronic components. RoHS stands for the Restriction of Hazardous Substances Directive, which refers to the restriction of the use

of hazardous substances such as lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE).

With the introduction of the RoHS EU Restriction of Hazardous Substances Directive, infrared detectors based on mercury cadmium telluride (HgCdTe), lead selenide (PbS) and lead sulfide (PbSe) will be banned from industrial applications after July 2024, which will further stimulate the transition to infrared detectors based on I-V semiconductors.
