Abstracts

According to our (Global Info Research) latest study, the global Coomassie Brilliant Blue market size was valued at US\$ 293 million in 2025 and is forecast to a readjusted size of US\$ 460 million by 2032 with a CAGR of 6.6% during review period.

Coomassie Brilliant Blue is a triphenylmethane acid dye centered on G-250 and R-250. Its key feature is the ability to form non-covalent complexes with proteins and generate a stable blue signal. It is mainly used in SDS-PAGE, Native PAGE, residual protein detection after Western transfer, and Bradford protein concentration assays. Gross margins for conventional powders and general staining solutions are mostly 45%-60%, while high-end ready-to-use, low-background, and mass spectrometry-compatible formulations can reach approximately 60%-70%.

Demand for Coomassie Brilliant Blue is based on protein electrophoresis and routine protein quantification experiments, with research institutions, biopharmaceutical R&D, diagnostic reagent development, and CRO laboratories as the main use scenarios. R-250 still serves low-cost routine gel staining, while G-250 is more used in colloidal staining, rapid destaining-free staining solutions, and Bradford protein quantification reagents. Therefore, the product structure is upgrading from low-priced powders toward finished, low-toxicity, and workflow-compatible reagents.

The core growth driver is the increase in protein analysis workload brought by proteomics, antibody drug, and cell/gene therapy R&D. Compared with silver staining, fluorescent dyes, and BCA assays, Coomassie Brilliant Blue has advantages in low cost, simple operation, and low equipment requirements, and is sufficient for most routine detection sensitivity needs. Its weakness is that sensitivity and quantitative

linearity are inferior to some high-end technologies, so its growth is more steady than explosive.
