Abstracts

According to our (Global Info Research) latest study, the global Copolymer POM Resins market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Copolymerized polyoxymethylene (CoPOM) is a polymer compound obtained by copolymerization of trioxane and a small amount of other monomers (such as dioxolane). Copolymerized polyoxymethylene has good thermal stability and can be processed in a wide temperature range. The processing temperature range is usually wider than that of homopolymer (processing temperature range of about 50°C), and it is not easy to decompose. Copolymerized polyoxymethylene has good stability to acids and alkalis and can resist a certain degree of chemical corrosion, which makes it have better application prospects in some special environments. Copolymerized polyoxymethylene still maintains high hardness and wear resistance, and can meet some application scenarios with high requirements for mechanical properties of materials. Due to the above-mentioned excellent performance characteristics of copolymerized polyoxymethylene, it is widely used in many fields such as automotive industry, mechanical equipment, electronic products, consumer products, etc.
