The global Copper-aluminum Composite Battery Connecting Sheet market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Copper-aluminum composite battery connecting piece is a component used for battery assembly and connection, usually used in various types of batteries such as lithium-ion batteries. These connectors are made of two different metal layers, copper and aluminum, because copper and aluminum have good electrical and thermal conductivity. Copper is typically used to carry electrical current, while aluminum is used to dissipate heat. This composite structure can improve the performance of the battery connecting piece, reduce resistance and heat generation, and contribute to the stability and life of the battery.

The main function of the battery connector is to connect the positive and negative terminals of the battery so that current can flow inside the battery, and also to dissipate the heat generated inside the battery to prevent overheating and damage. Copper-aluminum composite battery connectors are typically used between the positive and negative terminals of the battery to ensure smooth flow of electricity while effectively managing heat, which is critical to battery performance and safety.
