Abstracts

According to our (Global Info Research) latest study, the global Copper-based Arsenic Removal Adsorbent market size was valued at US\$ 17.70 million in 2025 and is forecast to a readjusted size of US\$ 23.26 million by 2032 with a CAGR of 4.0% during review period.

Copper-based Arsenic Removal Adsorbents are fixed-bed purification materials composed primarily of copper oxide or copper-containing composite oxides as the active components, supported on porous materials such as activated alumina. They primarily remove arsine (AsH₃) from gaseous or liquid hydrocarbon streams via chemisorption while simultaneously removing phosphine (PH₃), hydrogen sulfide (H₂S), and carbonyl sulfide (COS). By reducing impurity levels to the ppb range, they protect downstream catalysts used in selective hydrogenation, polymerization, and precious metal-based processes.

The upstream segment of the industry chain comprises copper sources (e.g., copper oxide, copper nitrate, basic copper carbonate), supports (e.g., activated alumina, silica-alumina materials), composite components (e.g., zinc oxide, manganese oxide), and additives such as binders, pore-forming agents, and molding aids. Midstream enterprises manufacture the fixed-bed products through processes including impregnation, co-precipitation, aging, drying, calcination, and shaping (into spheres, tablets, or extrudates). Downstream applications are concentrated in oil refining, steam cracking, FCC, MTO/MTP, and polyolefin units; these agents are typically installed upstream of selective hydrogenation or polymerization catalysts, and spent products are generally disposed of as arsenic-containing hazardous waste.

Global sales volume is projected to reach approximately 2,300 metric tons in 2025, with an average selling price of roughly US\$6,000–9,000 per ton and gross margins for leading manufacturers ranging from 30% to 40%.
