Copper cake and copper billet are two different forms of copper materials.

Copper cake: Copper cake is a product of copper material, usually a flat round block produced through smelting and casting processes. Copper cakes can be used as raw materials for manufacturing various copper alloys, copper products or other copper materials. Copper in this form is often used for further processing and manufacturing processes.

Copper billet: Copper billet refers to a preliminarily formed block of copper material without deep processing, generally with a square or rectangular cross-section. Copper billet can be prepared through smelting, casting, rolling and other processes. Copper billets are often the starting material for downstream manufacturing processes. For example, in a rolling mill, copper billets may go through processing steps such as rolling and drawing, and finally become copper products in various forms such as copper plates and copper wires.

In general, copper cakes and copper billets are the initial forms of copper materials, which can be further processed into various copper products in different manufacturing processes.
