Abstracts

According to our (Global Info Research) latest study, the global Copper Clad Laminate Hydrogen Resin market size was valued at US\$ 118 million in 2025 and is forecast to a readjusted size of US\$ 255 million by 2032 with a CAGR of 9.5% during review period.

Copper clad laminate hydrogen resin refers to a group of low-polarity and low-dielectric-loss hydrocarbon resin materials used in high-frequency and high-speed copper clad laminates. These resins are commonly combined with glass fabric, fillers and copper foil to produce CCL materials with stable electrical performance. They feature low dielectric constant, low dissipation factor, good moisture resistance and dimensional stability, making them suitable for 5G communication, millimeter-wave radar, satellite communication, servers, AI computing and high-speed PCB applications. In 2025, global Copper Clad Laminate Hydrogen Resin production reached approximately 3513 tons, with an average global market price of around US\$32710 per ton. The production capacity for Copper Clad Laminate Hydrogen Resin in 2025 was approximately 4000 tons. The typical gross profit margin for Copper Clad Laminate Hydrogen Resin is between 20% and 40%.

The copper clad laminate hydrogen resin market is mainly driven by the rising demand for high-frequency and high-speed PCBs, particularly in 5G base stations, automotive millimeter-wave radar, satellite internet, AI servers and high-speed networking equipment. Compared with conventional epoxy resin systems, hydrocarbon resins offer lower dielectric loss at high frequencies, making them important materials for premium high-frequency CCL products. Future competition is expected to focus on dielectric performance, thermal stability, process compatibility, supply reliability and localization capabilities.
