## Abstracts

The global Copper Foil Shield Paper market size is expected to reach \$ 77.95 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032). Copper Foil Shield Paper is a flexible composite made by bonding copper foil to electrical-grade insulating paper (typically kraft paper, crepe paper, cable paper, or pressboard-type paper). The copper layer provides a highly conductive surface for electrostatic/EM shielding and easy earthing, while the paper layer provides dielectric separation, mechanical support, and conformability for winding and wrapping operations.

Upstream materials mainly include copper foil (soft temper copper; sometimes tin-clad copper foil for better solderability/corrosion resistance), electrical insulation paper (kraft/crepe/pressboard family), and bonding systems (thermoplastic heat-activated adhesives, thermoset resins, or pressure-sensitive adhesive constructions depending on whether it is supplied as a laminate or a tape-like product). Copper's high conductivity improves shielding effectiveness, especially at higher frequencies, but oxidation control (surface protection, storage, or tin-cladding) is part of the material selection.

Downstream, copper foil?paper composites are primarily used in transformer/reactor insulation systems as earth/static shields and conductive layers within winding structures to improve electric-field distribution and reduce partial discharge risk. In practice, conductive strips/foils are combined with kraft/crepe paper wraps to form interwinding shields that are then connected to ground (or configured to avoid shorted turns). Related constructions are also used for EMI/RFI shielding and grounding in electrical/electronic assemblies where a conformable conductive foil layer with an insulating backing is needed.

In 2025, global sales of Copper Foil Shield Paper reached approximately 1,229 tons, with an average global market price of around US\$ 41/kg. Production capacity varies

significantly among manufacturers, with gross profit margins ranging from approximately 15% to 30%.

Copper foil shield paper is a functional insulation composite used in transformer and reactor insulation systems. By combining insulating paper with copper foil (or copper foil tape) into a controlled conductive/shielding layer, it helps manage electric-field distribution, mitigate partial-discharge risk, and provide a grounding path for static charge. Compared with standard electrical kraft or crepe papers, its value is driven less by paper tonnage and more by process quality: foil-to-paper bonding integrity, edge/burr control, defect minimization (air bubbles, delamination), oil-impregnation compatibility, thermal stability, and consistent handling behavior during winding and assembly. On the demand side, the most important tailwinds come from grid build-out and refurbishment, growing requirements for equipment reliability, and more stringent insulation-system design practices in transformers and reactors. Multiple authoritative sources have highlighted tight supply conditions and extended lead times for transformers and related grid equipment, which typically pushes OEMs to prioritize stable supply, qualification depth, and performance consistency for critical insulation and shielding materials.

On the supply side, competitiveness is shaped by three factors: (1) secure and consistent sourcing of copper foil and electrical-grade papers, (2) robust converting know-how (lamination, adhesive system design, cleanliness/defect control, and optional perforation/oil-flow considerations), and (3) engineering collaboration with transformer manufacturers for customized dimensions and process fit. Because copper is a major cost driver and its price fluctuates materially, suppliers with stronger process differentiation and tighter customer integration are generally better positioned to keep delivery and profitability more stable across commodity cycles.
