Abstracts

Core Type Induction Furnace is an induction heating equipment commonly used for metal smelting and heat treatment. Its design consists of a metal coil (also called an induction coil) and a metal core. This type of furnace has a metal coil wound around a metal core, and when energized by an induction heating power source, the magnetic field generated within the metal core causes a high-frequency alternating current to be generated in the metal coil. This current will produce electromagnetic induction in the induction coil, causing eddy currents inside the metal material to heat the metal.

According to our (Global Info Research) latest study, the global Core Type Induction Furnace market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
