## Abstracts

The global Corrosion Under Insulation (CUI) Monitoring Equipment market size is expected to reach \$ 139.1 million by 2029, rising at a market growth of 5.6% CAGR during the forecast period (2023-2029).

CUI is a prevalent industry problem affecting thermally insulated equipment in the onshore and offshore oil and gas industries, as well as the petrochemical, specialty chemical, fertilizer, and related industries. It is one of the most well-researched and understood damage mechanisms in the refining and chemical process industries, and yet it still represents an inordinately large percentage of global plant maintenance expenditures. For this reason, exercising good engineering practices during the design phase and throughout the entire lifecycle of equipment requiring thermal insulation is crucial. The design engineer concerned about CUI should specify a quality immersion grade metal coating, a durable water repellent thermal insulation installed with a complete well-sealed weather barrier/jacketing system with drainage features.

In the simplest terms, Corrosion Under Insulation (CUI) is any type of corrosion that occurs due to moisture present on the external surface of insulated equipment. The damage/attack can be caused by one of multiple factors, and can occur in equipment operating at ambient, low, and heated services, depending upon conditions. Moreover, CUI can occur on thermally insulated equipment that is in service, out of service, or in cyclic service. Because these surfaces are not generally available/accessible for visual examination, the onset of corrosion cannot be easily identified, and in extreme cases, severe corrosion with consequential loss of system integrity can occur.
