According to our (Global Info Research) latest study, the global Cosmetic Grade Hydroxyethyl Urea market size was valued at US\$ 251 million in 2025 and is forecast to a readjusted size of US\$ 351 million by 2032 with a CAGR of 4.8% during review period.

Cosmetic grade hydroxyethyl urea is a water-soluble moisturizing agent raw material, belonging to the functional additive of urea derivatives in cosmetics. Its CAS number is 2078-71-9, and its appearance is mostly white crystalline powder or transparent liquid. It is mainly used as an efficient moisturizing and softening ingredient in skincare and washing products. Its core function is to enhance the moisture content of the stratum corneum, improve skin dryness, and enhance skin sensation. It has good compatibility and a wide pH range in cosmetic systems, and is one of the functional raw materials that can replace some traditional moisturizers such as glycerol and propylene glycol. In 2025, global Cosmetic Grade Hydroxyethyl Urea production reached approximately 13,567 Tons, with an average global market price of around US\$ 17,967 per ton. The annual production capacity of cosmetic grade hydroxyethyl urea is 20,000 tons, with a gross profit margin of about 30%.

The upstream mainly consists of basic chemical raw materials (such as urea, ethylene oxide, and intermediates) and fine chemical synthesis enterprises; In the downstream, there are cosmetics brands and ODM factories, which are used in moisturizing systems such as face cream, essence, lotion, and cleaning products. This product usually has a low proportion in the terminal formula, but as a functional additive, it has a significant impact on the product experience, so the demand is stable and highly correlated with the prosperity of the skincare industry.

In terms of cost structure, raw material costs account for about 20% -35%, mainly from basic chemical raw materials; The production, manufacturing, and energy consumption costs are approximately 25% -35%, including reaction synthesis, purification, and solvent recovery; The cost of quality control and testing is about 10% -15%, involving purity, microbiological, and stability testing; Packaging, logistics, and loss of approximately 5% -10%; The R&D and compliance costs are approximately 10% -20%.

Hydroxyethyl urea is a brand new moisturizing agent with outstanding advantages. Compared with traditional moisturizers, hydroxyethyl urea has a more significant moisturizing effect, a smooth application feeling, a comfortable feeling of non stick, non greasy, and moisturizing in skincare products, and a wide range of applicability brought by its non-ionic properties. Moreover, compared to expensive moisturizers, hydroxyethyl urea can achieve the same effect at a lower formulation cost; Even in basic formulas mainly composed of glycerol and propylene glycol, hydroxyethyl urea can achieve better moisturizing effect, smoother coating feeling, and even lower formula cost by reducing the amount of other components that affect the appearance of the cream (such as silicone oil). Even under extreme conditions of 6% relative humidity, hydroxyethyl urea can achieve the goal of softening the skin by forming a liquid crystal phase with the stratum corneum, preventing the stratum corneum from transforming into a solid crystal phase.

Hydroxyethyl urea is an excellent moisturizer that provides efficient moisturizing effects for skincare products while maintaining a non sticky texture. It can reduce the amount of silicone used in the formula. Hydroxyethyl urea can penetrate into the stratum corneum, increase skin moisture content, relieve dryness, fill fine lines, increase skin elasticity, and provide a pleasant feeling of use. It can be compatible with a wide range of raw materials in cosmetics and has a wide range of pH applications.
