The global Cover Glass for Car-mounted Displays market size is expected to reach \$ 7729 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Cover glass for car-mounted displays is a functional glass component used as the outermost layer of automotive cockpit display and touch interfaces. It mainly covers center information displays, digital instrument clusters, passenger entertainment screens, rear-seat entertainment screens, automotive touch panels, HUD-related displays, and integrated smart cockpit surfaces. The core problem it solves is not simply covering the screen, but providing screen protection, visual clarity, touch sensitivity, scratch and impact resistance, low reflection, anti-glare performance, fingerprint resistance, decorative integration, and automotive-grade reliability under high and low temperatures, direct sunlight, vibration and impact, frequent touch operation, complex curved designs, and long-term safety-use conditions in vehicles.

The industry value of cover glass for car-mounted displays is shifting from a single protective material to a foundational visual interaction component for smart cockpits. As center displays, digital instrument clusters, passenger displays, rear-seat entertainment screens, and HUDs continue to expand in application, cover glass is no longer merely a protective layer on the outside of a display. Instead, it has become a key component that affects display clarity, touch experience, interior integration, and long-term safety and reliability. Technology competition is concentrated in chemically strengthened glass, curved forming, AG anti-glare treatment, AR anti-reflective coating, AF anti-fingerprint coating, decorative printing, and optical bonding. In the future, product added value will increasingly come from automotive-grade validation capability, complex curved processing capability, stable mass-production yield, and the ability to conduct

synchronized development with automakers and Tier 1 cockpit programs. The industry structure features both material supply and deep processing specialization. Japanese, American, and European companies have clear advantages in specialty glass substrates, automotive-grade material standards, and global vehicle program experience, while Chinese and Korean companies are more active in curved deep processing, coating, printing, bonding, and customized project delivery. With the continued penetration of smart cockpits and new energy vehicles, the overall market for this product still has strong growth potential.
