According to our (Global Info Research) latest study, the global CPU Rendering market size was valued at US\$ 2120 million in 2025 and is forecast to a readjusted size of US\$ 3296 million by 2032 with a CAGR of 6.6% during review period.

CPU rendering is the process of using the computer's central processing unit (CPU) to generate images by executing complex algorithms to simulate visual effects such as lighting, shadows, and materials. It is suitable for scenes that require highly accurate and complex calculations, such as high-precision rendering and offline rendering tasks in film production. Although slower than GPU rendering, CPU rendering excels in multi-threaded optimization and complex logic processing, and is widely used in graphics generation tasks that require fine control and flexibility.
