The global Crane Hook market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A crane hook is a load-bearing component of a crane that is used to lift and move heavy loads. It is designed to be attached to the hoist, which is used to raise and lower the hook with the load attached. Crane hooks come in a variety of sizes and configurations depending on the type and weight of the load being lifted. The main components of a crane hook include the hook body, the shank, the point, and the latch. The hook body is the part of the hook that the load is attached to, and the shank is the portion that attaches to the hoist line. The point is the part of the hook that makes contact with the load, while the latch is used to secure the load to the hook by preventing it from slipping off. Crane hooks are typically made of high-strength alloys or steel to withstand heavy loads and harsh conditions. They are subject to rigorous safety regulations and inspections to ensure that they are safe to use.
