Abstracts

Creatine powder can increase bodybuilders' weight, muscle explosive force and endurance. At the same time, creatine powder can bring water into muscle, which increases the size of muscle cells and is conducive to the absorption of amino acids by muscle cells. Reasonable use of creatine powder can also indirectly increase the muscle volume. Because more energy is available, athletes can carry out more intensive training, promote the growth of muscle through the cycle of 'muscle generates strength, and strength generates muscle'. At the same time, when muscle cells absorb creatine, they also bring more water to cells (hydration), which increases the cell volume and increases the synthesis speed of muscle protein, It promotes the growth of new muscles.
