## Abstracts

According to our (Global Info Research) latest study, the global Crohn's Disease market size was valued at USD 8905.9 million in 2023 and is forecast to a readjusted size of USD 10930 million by 2030 with a CAGR of 3.0% during review period.

Crohn's disease refers to long term inflammatory bowel disease, which causes inflammation of the lining of the digestive tract. It affects the large and small intestine and is generally diagnosed in persons within the age group of 20-29. It can have severe or acute outcomes. Signs and symptoms of Crohn's disease develop slowly and gradually. Some of the common symptoms of this disease include abdominal pain and cramping, fever, fatigue, diarrhea, blood in stools, appetite and weight loss. Inflammation of skin, joints, and eyes, inflammation of the liver or bile duct, and delayed sexual development in children are some other symptoms associated with severe Crohn's disease.

Rising number of drug therapies for Crohn's disease and increasing demand for better diagnostics and treatment options for the auto-immune disease are some of the key factors driving the growth of the global Crohn's disease market. In addition, rise in the number of patients suffering from auto-immune disorders in developing countries and increasing government initiatives for improving health care infrastructure are fueling the growth of the global Crohn's disease market. However, less awareness among people about the disease is also restraining the growth of the market. Patent expiry of various useful drugs, such as remicade and humira, is also impeding the growth of the market.
