According to our (Global Info Research) latest study, the global Crop Breeding Technology market size was valued at US\$ 5359 million in 2025 and is forecast to a readjusted size of US\$ 8284 million by 2032 with a CAGR of 6.5% during review period.

Global agriculture continues to face many challenges, including population growth, food security, and climate change. Technological innovation in the agricultural sector is needed to meet the growing demand for food. Innovations in plant breeding can help provide consumers with more choices while solving the challenges that farmers face every day in the field. Plant breeding is the process of crossing two plants to produce offspring with the best characteristics of their parents. Today, plants are bred to improve a variety of important characteristics, from improved agronomic performance to more consumer-oriented qualities such as size, taste, or color. By leveraging the genetic diversity that naturally exists in each crop family, plant scientists can determine which plants have the characteristics or traits they are looking for and design new varieties with those traits. Efficient and high-yield plant breeding requires advanced scientific knowledge and complex decision-making. Identifying and isolating genetic traits that help solve farmers' challenges can be difficult and time-consuming. After generations of research and discovery, plant breeding has moved beyond selecting parent plants based solely on appearance. It now includes a deep understanding of the genetic makeup of plants, allowing scientists to better predict which plants have the highest probability of success in the field and in the grocery store before crossing them.

Crop breeding technology is a vital part of agricultural production. Through technical means, the genetic characteristics of crops are improved, and crop yield, quality, pest resistance and adaptability are improved to meet the growing global population needs

and the challenges brought by climate change. In recent years, with the advancement of modern science and technology, especially the rapid development of molecular biology, genomics and information technology, crop breeding technology is undergoing a revolution. The combination of traditional breeding methods and modern scientific and technological means has brought new opportunities and challenges to agricultural production.

At present, the global crop breeding technology market has shown a trend of diversification and intelligence. Traditional crop breeding techniques, such as hybrid breeding, variety selection and seed breeding, are still widely used in many regions, but their efficiency is relatively low and the cycle is long. In recent years, technologies such as gene editing, genome selection and molecular marker-assisted selection (MAS) have gradually emerged, significantly improving the efficiency and accuracy of crop breeding. In particular, the emergence of CRISPR gene editing technology has made the improvement of crop genomes more accurate and efficient, which can not only change the specific traits of crops, but also accelerate the research and development of new crop varieties.

In addition, with the rise of precision agriculture, technologies such as big data, the Internet of Things, and artificial intelligence have also been widely used in the field of crop breeding. By combining genomic data with environmental data, breeders can more accurately predict the interaction between crop genes and the environment, thereby optimizing breeding strategies and improving crop adaptability. Global large seed companies, such as Monsanto, DuPont Pioneer, and Bayer, have strengthened their dominant position in the crop breeding market by acquiring and investing in advanced genetic technology platforms.

Global key players of Microwave Coax Cable include BASF, Corteva Agriscience (Pioneer Seeds), Sinochem Holdings (Syngenta), Bayer, Advanta, etc. The top three players hold a share about 46%. Asia-Pacific is the largest market for Microwave Coax Cable and has a share about 37%, followed by North America and Europe, with share 29% and 19%, separately. In terms of product type, traditional breeding is the largest segment, occupied for a share of 28%. In terms of application, cereal seeds is the largest segment, occupied for a share of 53%.
