Remote sensing is the newest technology which has an increased use in agriculture for its enduring properties of yield estimation and crop damage assessment. Remote sensing is the process of obtaining information about an object or area, without having any physical contact, typically from an aircraft or satellite. It is increasingly being adopted by farmers as it helps in crop identification, crop condition assessment and stress detection. It also helps in the identification of planting and harvesting dates along with pest and disease infestation, crop yield modelling and estimation, and soil moisture estimation and mapping. This results in reducing costs and time invested on fertilizers. The global Crop Production market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
