Crop production industry includes growing crops, plants, vines, or trees and their seeds by establishments such as farms, orchards, groves, greenhouses and nurseries.

Remote sensing is the newest technology which has an increased use in agriculture for its enduring properties of yield estimation and crop damage assessment. Remote sensing is the process of obtaining information about an object or area, without having any physical contact, typically from an aircraft or satellite. It is increasingly being adopted by farmers as it helps in crop identification, crop condition assessment and stress detection. It also helps in the identification of planting and harvesting dates along with pest and disease infestation, crop yield modelling and estimation, and soil moisture estimation and mapping. This results in reducing costs and time invested on fertilizers.
