A cross clamp is a device used in optical systems, such as those involving lasers, to securely hold a pole or rod at a specific angle. This allows for precise positioning of various optical elements within the system.

Cross clamps are crucial in directing laser beams for material analysis and irradiation. They hold rods attached to optical elements, enabling easy adjustment of the optical path by altering the rods' height and angle. This adjustability is particularly valuable in the manufacturing of optical instruments and academic research.

Clamps, in general, are tools for securing materials in various fields. In construction, they hold materials to tables, while in medicine, they function like clips to hold tubes. Cross clamps specifically serve to fix rods and poles crucial for positioning optical elements in optical instruments. These rods typically range in diameter from 12 mm to 20 mm.
