Abstracts

Polyethylene (PE) cross-linking technology is one of the important means to improve its material properties. Crosslinked modified PE can greatly improve its performance, not only significantly improve the comprehensive properties of PE mechanical properties, environmental stress crack resistance, chemical corrosion resistance, creep resistance and electrical properties, but also very significantly improved the temperature resistance level, which can increase the heat-resistant temperature of PE from 70 ° to more than 100 °, thereby greatly expanding the application field of PE. High density polyethylene is the main type of PEX, and almost all PEX used in pipelines are made of high density polyethylene. The excellent combination of properties makes HDPE an ideal material for a variety of applications in a variety of industries. Unlike traditional systems that use copper for pipes and piping, crosslinked high density polyethylene does not corrode and maintains its flexural strength.

According to our (Global Info Research) latest study, the global Cross-linked High Density Polyethylene market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
