Crude oil dehydration unit is a kind of equipment specially used to remove water from crude oil, which is one of the important steps in crude oil processing. Crude oil often carries a certain amount of water with it during production. This water may come from subsurface water, drilling fluid, flushing fluid or water in the formation itself. The presence of water not only reduces the quality and value of crude oil, but also has negative effects on subsequent refining processes, such as corrosion of equipment, reduction of thermal efficiency, and impact on catalyst performance. Therefore, crude oil must be dehydrated before entering the refinery. Crude oil dehydration units usually use physical or chemical methods to separate oil-water mixtures.
