Abstracts

The global Cryo-EM Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Cryo-EM technology is a technique used to preserve and examine the micro- and nanostructure of liquids and their interactions with substrates. Cryo-EM technology can obtain high-resolution structural images of biological macromolecules by freezing biological samples in liquid nitrogen and using electron microscopy under extremely low temperature conditions. These structural images can help researchers study the three-dimensional structure of macromolecules, including biomolecules such as proteins and DNA. The method is particularly valuable for studying phenomena such as emulsions, dispersions and gel-based aqueous chemical products as well as biological samples, all of which are performed at low temperatures via cryopreservation.

Cryo-EM Services usually provide a series of services, including sample preparation, data acquisition, image processing and resolution reconstruction, etc. These services can provide researchers with a full range of technical support to help them better perform cryo-EM experimental design and data analysis.

This report studies the global Cryo-EM Services demand, key companies, and key regions.
