## Abstracts

The low temperature pulverizer system is used for various materials that cannot be pulverized under normal temperature. Particle size has a major impact on the texture, mouthfeel and processing of spices. The size of each particle affects the reactivity, flow and solubility of ingredients.

Achieving the desired particle size distribution usually varies for each spice, as some require freezing. High-oil spices like nutmeg and nutmeg require a different process—low-temperature grinding. The cryogenic grinding process cools the spices with liquid nitrogen to embrittlement temperature before sending them to the grinder, ensuring optimum particle size. Removing the heat helps the spices retain their optimum flavor and prevents the volatile components of the spice from dissipating.
