Abstracts

The global Cryogenic Storage Tubes market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Cryovials are tubes made from autoclavable polypropylene material. All polyethylene, including polypropylene, are characterized as polyolefin, a compact-molecular hydrocarbon. Its chemical makeup is the same as polyethylene; however, every unit contains a methyl group attached to it. Its chemical composition enables it to be non-contaminating, lighter than H₂O, and non-toxic.

The abovementioned traits are why polyethylene is the best material for making cryovials. Cryovials are designed to store biological material at shallow temperatures of about -196 °C, which Liquid Nitrogen achieves in gas form.

This report studies the global Cryogenic Storage Tubes production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Cryogenic Storage Tubes, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
